

# **Sociodemographic and Health-Related Characteristics of Members Aged 20 and Over in the Redwood City Medical Center Service Population, 2014/2015**

Estimates are based on self-reported data for adults aged 20 and over who responded in the 2014/2015 cycle of the Kaiser Permanente Northern California Region Member Health Survey:

- Sociodemographic characteristics, including usual mode of transportation
- Health status, health conditions, and functional status
- Health behaviors and psychosocial risks
- Actions members are taking to try to maintain or improve their health
- IT access (computer, Internet, email, mobile phone, text messaging)
- Preferred methods for receiving health information and health education

The Member Health Survey is a project funded by Kaiser Permanente's Northern California Region Community Benefit Program (CB). These survey results are being made available to the public as part of Kaiser Permanente's commitment to sharing research findings based on our membership that might inform decisions about methods of outreach to improve the health of our communities. This information should not be used as the basis for any professional publication without permission of Dr. Nancy Gordon, and slides used for presentations should credit the Kaiser Permanente Member Health Survey as the source.

We suggest that statistics from this report be referenced as follows:

# Characteristics of Adult Members in Kaiser Permanente's Redwood City Medical Center Service Population, as estimated from the 2014/2015 Kaiser Permanente Adult Member Health Survey

Report prepared October 2017  
Nancy P. Gordon, ScD  
Member Health Survey Director  
Division of Research

## Background

The Member Health Survey is a triennial mailed questionnaire survey conducted during the Spring-Summer of a survey year with a randomly selected sample of adults who are current members of the Kaiser Permanente Medical Care Program in Northern California. The primary purposes of the survey are:

- To learn about the health-related needs and interests of the culturally diverse Kaiser Permanente Northern California adult membership, and by extension, members of the communities we serve;
- To provide information for health services planners to make evidence-based decisions about health information and health care service delivery; and
- To support research to improve the health of our members and the communities we serve.

The Member Health Surveys project is funded by Kaiser Permanente's Northern California Community Benefit (CB) Program. This report presents statistics estimated from the 2014/2015 survey cycle. Similar member health surveys were conducted in 1990, 1993, 1996, 1999, 2002, 2005, 2008, and 2011, and reports and survey questionnaires are available on our website [www.memberhealthsurvey.kaiser.org](http://www.memberhealthsurvey.kaiser.org) or by request.

From a strategic perspective, the process of identifying high priority health problems and health practices/lifestyle factors known to increase the risk of chronic or acute illness and targeting effective interventions at those persons in the population who are most at risk should lead to improved health status and more cost-effective use of health care dollars. The identification of age-specific prevalence rates for these health problems and lifestyle risks can also be used for forecasting the resources that will be required to provide health services in the future.

Similar to state and national health surveys, the Member Health Survey captures health risk and health status data on a relatively small proportion of the adult population for which information is desired. However, we hope the survey results will provide administrators, program planners, and researchers with a profile of the membership that can be used to identify areas for new or expanded health promotion/health maintenance interventions, social support services, and more efficient medical care delivery; study patterns and costs of care for particular types of patients by linking survey data to computerized and medical record information; and compare the health-related characteristics of their service population across medical center service populations and service areas, as well as with the general population.

## 2014/2015 Redwood City Medical Center Service Population Survey Sample

Data collection for the 2014 survey cycle was split across two years, with half of the usual number of members in each medical center service population surveyed in 2014 and the other half in 2015. In the 2014/2015 cycle, we mailed questionnaires to a stratified random sample of 2245 adult Health Plan members in the Redwood City Medical Center Service Population (MCSP). Members are assigned to an MCSP based on where they receive or would be expected to receive most of their primary care. Only current members who had been continuously enrolled during the three months prior to the survey and had no indication that they required an interpreter to communicate in English were sampled. Two subsequent survey packet mailings were sent over the next several weeks to

non-respondents, with the final wave of questionnaires mailed in September. Participants were also offered the opportunity to answer a secure online version of the questionnaire reached via a link emailed to them or log in at the Member Health Survey Participant Home Page. Phone administration was available on request but not used. Non-eligibles (deceased, non-current members, members living outside the main service area) and members for whom Kaiser Permanente nor the U.S. Postal Service had forwarding addresses were dropped from the initial sample and replaced with other randomly selected members of the same age and sex from the same medical service area population.

The overall survey response rate for members sampled from this service area population was 38.6%.

Final Response Rates for the 2014/2015 DOR Member Health Survey by Age-Gender Group, Members Aged 20 and Over in the Redwood City Medical Center Service Population Sample

	<u>20-44</u>	<u>45-64</u>	<u>65 and Over</u>	<u>20 and Over</u>
Women	147/463 (31.7%)	129/302 (42.7%)	168/257 (65.4%)	444/1022 (43.4%)
Men	92/511 (18.0%)	122/347 (35.2%)	167/257 (65.0%)	381/1115 (34.2%)
Total	239/974 (24.5%)	251/649 (38.7%)	335/514 (65.2%)	825/2137 (38.6%)

All respondents were assigned a post-stratification weighting factor based on the age-gender distribution of the medical center service population from which they were selected as of the end of the fourth quarter of 2013. The table below shows the age distributions of women, men, and all adults aged 20 and over after and before applying the post-stratification weighting factor. The estimates of sociodemographic and health-related characteristics in this report are based on weighted survey data.

Age Distribution	Women		Men		All	
	Wtd %	(Unwtd %)	Wtd %	(Unwtd %)	Wtd %	(Unwtd %)
20-44 yr	42.0	32.8	44.0	23.7	43.0	28.7
45-64 yr	39.0	31.9	39.5	35.7	39.2	33.6
65 and over	19.0	19.1	16.5	18.6	17.8	37.8

Because the service population samples are small, the precision of the estimates (i.e., confidence intervals around the percentage) are quite large. Please keep this in mind when making comparisons with other sources of data. The statistics contained in this MCSP report may be best used to compare against the Regional Profile report.

Since the questionnaire only went out in English and very limited English-speaking members were excluded from the survey sample, non-English speaking members and members with very poor reading ability are not represented in this survey. An internal study that matched survey response status for the 2011 survey to a member race/ethnicity dataset (91% match rate for women and 84% match rate for men) found that among both women and men, non-Hispanic White, Chinese, Japanese, and Korean members were more likely to respond than African-American/Other Black, Latino, and Filipino members. The differential race-ethnic response rate, exclusion of non-English speakers and members with very low literacy, and lower response rates among young and middle-aged adults compared with adults aged 20 and over, yields a final weighted respondent sample that underestimates African-American/Blacks and Latino/Hispanic members and overestimates some of the Asian ethnic groups. Finally, results of other surveys suggest that among older members, the very sickest and frailest are unlikely to have responded.

## Description of the Contents of Tables in this Report

In the tables, a double dash ( - - ) signifies that men, women, or people in this age group were either not asked those questions or that the items were not considered relevant to the age group or gender. A percentage of <0.1 is used when <0.05% (weighted) or no respondents indicated that response.

**Table 1** presents estimates of sociodemographic characteristics of adult Health Plan members.

**Table 2** presents estimates of the percentages of adult members who experienced selected chronic diseases and health problems during the previous 12 months, based on self-report unverified by medical record review or physician report. Also included in this table are estimated percentages of members who consider their overall, physical, and emotional/mental health to be excellent, good, fair, or poor, and the extent to which these components of health affect their activities.

**Table 3** presents estimates of the percentages of adult members with selected health and lifestyle risks, including tobacco and alcohol use, exercise, dietary behaviors (fat, salt), obesity, stress, hours of sleep, belief about the extent to which health habits/ lifestyle and stress/emotional troubles impact on health, and selected psychosocial stressors experienced during the previous year.

**Table 4** presents estimates of the percentages of adult members who are engaging in different health-related behaviors to try to improve their health.

**Table 5** presents estimates of the percentages of adult members who received a flu shot for the past flu season, ever had a pneumonia shot (seniors only), and had a routine dental check-up in the past 12 months. (Note: the survey no longer collects self-reported information on recency of screening tests).

**Table 6** presents estimates of use of complementary and integrative health (CIH) modalities by adult members during the previous 12 months.

**Table 7** presents estimates of member access to digital tools for communication and health information (mobile phone, text messages, computer, Internet, and email)

**Table 8** presents estimated use of different KP and non-KP health information sources during the previous 12 months.

**Table 9** presents estimated percentages of adult members who indicated different preferences for receiving health information and learning about how to take care of their health, and **Table 10** presents these estimates for people who indicated at least one method preference.

Footnotes for Table 1:

- <sup>1</sup> Estimates are derived from self-report data for Redwood City Medical Center Service Population respondents aged  $\geq 20$  to the 2014/2015 Division of Research Northern California KP Member Health Survey weighted to age-, gender-, and geographic- distribution of the Health Plan membership in 4th quarter 2013.
- <sup>2</sup> Algorithm for assigning individuals to one race/ethnicity for purposes of estimation was as follows: White if only White/Euro-American indicated; African-American/Black if African-American or Other Black indicated alone or with any other race/ethnicity; Latino/Hispanic if that category indicated alone or in combination with any other race/ethnicity except for African-American/Black; Asian if one or more of Chinese, Japanese, Korean, Filipino, Southeast Asian, Indian/Pakistani, or Other Asian category indicated and African-American/Black and Latino/Hispanic not indicated; Hawaiian or Pacific Islander if ethnicities in this group were indicated but not African-American/Black, Latino/Hispanic, or Asian race/ethnic categories. Native American/Alaska Native if this category was the only one indicated; and Other if Middle Eastern or Other indicated, but not African-American/Black, Latino/Hispanic, or Asian race/ethnic categories. The sum across these broad categories should be approximately 100%.
- <sup>3</sup> Asian race/ethnic category includes Chinese, Japanese, Korean, Filipino, Southeast Asian, South Asian (e.g., Indian/Pakistani), or other Asian subgroup.
- <sup>4</sup> May exceed 100% due to non-exclusive categories.
- <sup>5</sup> Asked only on questionnaires for women and men aged 20-64.

Footnotes for Table 2:

- <sup>1</sup> Estimates are derived from self-report data for Redwood City Medical Center Service Population respondents aged  $\geq 20$  to the 2014/2015 Division of Research Northern California KP Member Health Survey weighted to age-, gender-, and geographic- distribution of the Health Plan membership in 4th quarter 2013.
- <sup>2</sup> Estimate based on indication of the health condition or reported use of medication to control that health condition.
- <sup>3</sup> Estimates based on responses to a health condition checklist and a question about use of/need for a hearing aid. Estimates for those aged 20-64 based only on response to health condition checklist.
- <sup>4</sup> Depression was estimated from indication of depression, sadness, or very low spirits lasting at least 2 weeks in a health condition checklist or indication of use of a prescription anti-depressant during the previous 12 months.
